

AIR LAND & WATER

2010 Oklahoma Ice Storm

Guidelines for Debris Management

fact sheet

This fact sheet is intended to assist public officials in making decisions about debris management. There are several key considerations (listed below) in the decision process.

- Need for rapid removal
- Reimbursement by the Federal Government
- Protection of the public health and environment
- Future liability

OPTIONS FOR DEBRIS DISPOSAL

In an effort to assist with debris management, DEQ has compiled a list of options—in order of preference—based on economic and environmental reasons. Each community is free to choose one or more of these options, based on the conditions surrounding its particular circumstances.

- Chipping or cutting tree limbs for re-use or for volume reduction for disposal in a landfill or burial on-site.
- Setting up emergency disposal sites for burning tree limbs and burying the ashes or burying tree limbs. (*This may be the best option for disposal in remote areas.*)
- Disposing of all tree limbs at a permitted landfill.

Regardless of which option or combination of options are chosen, the potential of recovering reimbursable costs from FEMA is dependent upon compliance with all applicable state and federal environmental requirements. This guidance helps you comply with these regulations.

Chipping Tree Limbs

The preferred option for disposing of tree limbs is chipping or cutting the limbs for re-use as mulch or firewood. If you choose to chip or cut tree limbs, you must set up one or more staging areas where citizens or cleanup crews can take tree limbs and also pick up mulch or firewood.

Staging areas must be registered with DEQ and meet the following criteria:

- Must be located above the 100-year floodplain and outside known wetlands. (The floodplain map used for locating the site shall be an original *Flood Insurance Rate Map* prepared by the Federal Emergency Management Agency, a copy of

the *Flood Prone Area Map* prepared by the US Geological Survey or an equivalent constructed map depicting the limits and elevations of any 100-year floodplain on or adjacent to the proposed site.)

- Must be located at least one-quarter mile from a public or private water supply (surface or ground).
- Staging areas must be monitored to ensure putrescible waste, rubber, and plastics are excluded. In **no case** shall hazardous waste, radioactive waste, regulated polychlorinated biphenyls (PCB) waste, or regulated infectious wastes be allowed at staging areas.
- Additional federal criteria must also be met in selecting these sites to qualify for FEMA reimbursement. (*Consult FEMA for assistance with these criteria.*)

NOTE: If you choose to bury excess mulch or firewood on-site, you must also meet the requirements for emergency disposal sites listed on the next page.

For information regarding the availability of chippers in your area, contact Fenton Rood at (405) 702-5100.

Emergency Disposal Sites

DEQ can assist in establishing emergency disposal sites for storm debris. Emergency disposal sites can be used to: (1) burn tree limbs and bury the ashes; (2) bury tree limbs (whole, chipped or cut); or (3) a combination of the two.

The requirements listed below are intended to minimize the threat of harm to public health and the environment, and to minimize future liability. All of these requirements must be met if you choose to stockpile, burn and/or bury at emergency disposal sites:

- Emergency disposal sites shall meet all of the requirements listed above that apply to staging areas.
- Treated wood products (i.e. utility poles) are not to be disposed of in emergency disposal sites
- Emergency disposal sites may only be used to dispose of tree limbs and tree trunks.
- All burning must be located at least 500 feet (preferably one-half mile) from an occupied residence.
- Any burning must be controlled so that the smoke does not create a traffic hazard.
- To avoid explosion hazards, no burning can take place on or near petroleum pipelines.

- Provisions are in place to exclude burning rubber, plastics, asbestos, and other similar materials that produce unreasonable amounts of air contaminants.
- Provisions are in place to ensure that hazardous waste, radioactive waste, regulated polychlorinated biphenyls (PCB waste), or regulated infectious wastes are excluded.
- To achieve the most efficient burn, minimize the amount of dirt and other non-combustible materials.
- Personnel with fire fighting equipment shall be on-site during any burning.
- Area residents shall be notified if open burning is to occur.

NOTE:

Open burning of storm debris is the least efficient method of burning, leaving a large amount of residual ash and causing a great amount of particulate emissions. Using an open pit incinerator is a better choice due to its higher combustion efficiency.

Burying solid waste in an unlined pit may present a threat to the public health and environment and could become an unintended future liability for the community and the landowner. As such, this practice should be considered only as a last resort.

Disposal at Permitted Landfills

SITE SELECTION

Local environmental specialists can assist you with finding a suitable site and complying with any state and federal environmental requirements. Staging areas and disposal sites can be located on publicly owned property or on private property. (A legal access agreement must be completed in the event that you choose to use private land for a staging area

or a disposal site.) All sites used as staging areas or emergency disposal sites must be registered with FEMA using the included “Emergency Disposal Site Evaluation and Registry” form.

Legal Access Agreement forms and Emergency Disposal Site Evaluation and Registry forms may be obtained at your local DEQ office:
